Does the effect survive? Evidence from panel data

We estimate that a one percentage point increase in the minimum wage reduces employment by 0.15% (s.e. 0.04), or about -12,500 jobs in the average state. The estimated elasticity is -0.18 with a 95% CI of [-0.26, -0.10].

Specification	Estimate	Std. Error	95% CI
Baseline	-0.150	0.040	[-0.23, -0.07]
With controls	-0.180	0.041	[-0.26, -0.10]

The response is concentrated in manufacturing, where the informa-
tion on wages is measured at the establishment level.
